

Name: Kerelos Zakarya Tadros

ID : 2205191

The Comparison occurred in number 14 in both.

Comparison

Metric	5G Conspiracy	Non-Conspiracy
Nodes	26	26
Edges	61	53
Average Degree	2.346	2.038
Density	0.094	0.082
Weakly Connected Components	1	1
Strongly Connected Components	6	18
Diameter	5	4
Radius	3	2
Average Path Length	2.3867	1.8817
Modularity (Q)	0.401	0.236
Communities	4	5
Clustering Coefficient	0.169	0.391

The Explaination :

The Connectivity(Average Degree - Denisty) :

5G Conspiracy networks tend to be more interconnected, helping the same message circulate repeatedly within the group having degree and density higher than the non- Conspiracy network.

Modularity (Q) and number of communities :

Higher Modularity in the 5G network means it forms stronger more isolated this lead to spread of misinformations fastly and effective

The conspiracy graph has fewer, more polarized communities.

Clustering Coefficient :

The normal network shows strong triadic closure friends-of-friends connections that expected in real life

The 5G network has a no triadic closure centered around a few influential accounts.

Connected Components :

The conspiracy network has fewer SCCs, meaning it is more tightly connected and more reciprocal internally.

The normal network is more structured and connected as expected in real social groups.

Path Metrics :

Information spreads faster in the normal network short path length.

The 5G network has more longer paths, meaning information take longer to reach

Due to the dependant on centralized structure node

Thank You
